AZ CORP COMMISSION  
DOCUMENT CONTROL

IN THE MATTER OF THE GENERIC ) DOCKET NO. RE-00000A-99-0205  
 INVENTIGATION OF THE DEVELOPMENT OF )  
 A RENEWABLE PORTFOLIO STANDARD AS A ) TUCSON ELECTRIC POWER  
 POTENTIAL PART OF THE RETAIL ELECTRIC ) COMPANY'S POST-HEARING  
 COMPETITION RULES. ) BRIEF  
 )  
 )

Tucson Electric Power Company ("TEP"), through undersigned counsel, and pursuant to the Chief Hearing Officer's order, submits this Post-Hearing Brief.

**I. Introduction.**

TEP is committed to increasing the use of renewable resources in its generation portfolio. That commitment was bolstered three years ago with TEP's affiliation with Global Solar, a maker of photovoltaic modules which will ultimately produce significant solar capacity. TEP has also developed a program that co-burns landfill gas at its Irvington Generating Station in Tucson. This co-burn process displaces coal and produces less overall emissions than separate combustion, thus meeting TEP's 1994 IRP renewable goals in a cost effective manner. Additionally, TEP has investigated utilizing wind resources, and is presently surveying promising wind microsites in Apache County.

TEP supports a Renewable Portfolio Standard in Arizona that is consistent with the goals of electric competition and the long-term power needs of the State. The promise of competition has been lower rates for all customers. Thus, TEP has proposed a Renewable Portfolio Standard that will not increase rates, especially in the competitive market's early years, and will not place

1 any electric service provider or load serving entity at a competitive disadvantage. TEP's  
2 proposal utilizes the existing System Benefits Charge in the first few years of competition, and  
3 allows for an expansion of the renewable program in future years as the competitive market  
4 matures.

5 TEP has also joined with other parties in submitting a joint proposed Renewable Portfolio  
6 Standard that will not increase rates. Although the joint proposal differs somewhat from TEP's,  
7 the basic thrust of the joint proposal -- to fund a Renewable Portfolio without adversely affecting  
8 rates -- is exactly what TEP has advocated throughout these proceedings.

9  
10 **II. Rates Should Not Increase As A Result Of The Renewable Portfolio Standard.**

11 The starting point for TEP's proposal is that the Renewable Portfolio Standard should  
12 neither result in a rate increase for consumers, nor reduce the rate decreases consumers will  
13 receive as a result of its settlements. This principle should be obvious: the Commission has  
14 made clear that a goal of electric competition is to lower rates.

15 Nonetheless, the Arizona Clean Energy Industrial Alliance ("ACEIA") takes the position  
16 that rates should increase if that is what it will take to encourage the development of solar and  
17 other renewable power. *See* Hearing Transcript at 352:13-19; 353:23 to 354:6; 406:5-20;  
18 519:10-18. ACEIA is a coalition of companies in the solar and renewable energy business. It  
19 represents neither Arizona consumers nor utility shareholders. Thus, it is not surprising that  
20 ACEIA would advocate rate increases as a vehicle for stimulating the solar and renewable  
21 industry.  
22

23 TEP urges the Commission to reject this position. The Commission has worked hard to  
24 ensure that competition provides an immediate benefit to consumers. The rate decreases set  
25 forth in the TEP settlement provide that benefit. The Commission should not partially or fully  
26 eliminate those decreases in order to finance the Renewable Portfolio Standard.  
27  
28

1           **III. The Renewable Portfolio Standard Should Utilize The Existing System Benefits**  
2           **Charge.**

3           TEP proposes that the Renewable Portfolio Standard utilize a portion of the existing  
4           System Benefits Charge and be designated as a fixed dollar amount per kWh. Using the existing  
5           System Benefits Charge will ensure that the Renewable Portfolio Standard does not result in rate  
6           increases and will provide the proper incentives to increase efficiency in solar and other  
7           renewable power.

8           Under the Commission's proposed Renewable Portfolio Standard, a fixed percentage of  
9           each ESP and UDC's total load must be generated through solar or other environmentally-  
10          friendly renewable means. It further imposes a penalty of \$.30 per kWh for failing to meet the  
11          percentage requirement. Basing the Renewable Portfolio Standard on a percentage of energy  
12          sold is troublesome for several reasons. First, by TEP's calculations, the proposed Renewable  
13          Portfolio Standard will increase consumer costs by 5.5% for the first five years. *See* Direct  
14          Testimony of Thomas N. Hansen, at p. 9, lines 24-27. For TEP at least, this leaves two options.  
15          One is to increase rates, something TEP's Settlement Agreement prohibits. The other is for  
16          TEP's shareholders to bear these additional costs. This, too, is unacceptable, particularly given  
17          the rate decreases to which TEP will already be subject pursuant to its Settlement Agreement.  
18          For ESPs, the problem is somewhat different. The increased cost resulting from a

19          percentage of load requirement will cut into already thin margins, thus making fewer customers  
20          attractive to ESPs.  
21          A percentage standard also gives renewable energy companies little incentive to keep  
22          costs low. Rather, their incentive is to price their services just below the penalty level of \$.30

23          per kWh. Under TEP's proposal, a fixed amount of money will be devoted to renewable  
24          resources. Thus, as costs per kWh decrease, the amount of renewables used will increase.  
25          Thus, as costs per kWh decrease, the amount of renewables used will increase.  
26          Thus, as costs per kWh decrease, the amount of renewables used will increase.  
27          Thus, as costs per kWh decrease, the amount of renewables used will increase.  
28          Thus, as costs per kWh decrease, the amount of renewables used will increase.

1 Finally, adoption of a percentage standard may force TEP and other UDC's to make  
2 investment in solar and other technologies that may soon become stranded investment as those  
3 technologies become outdated. The risk of stranded investment is eliminated by adopting a  
4 Renewable Portfolio Standard that is based on fixed per kWh charge.

5 **IV. The Commission Should Adopt TEP's Three-Phase Proposal.**

6 Based on the foregoing considerations, TEP has proposed that the Renewable Portfolio  
7 Standard be implemented in three phases.

8 In phase one, each UDC will utilize the portion of its existing System Benefits Charge  
9 already allocated to renewable energy sources, and will devote those funds to the development  
10 and procurement of solar and renewable energy. ESPs will be required to impose a per kWh  
11 charge on their customers commensurate with the portion of the System Benefits Charge which  
12 is devoted to renewables, and will be required to use those funds to procure or develop their own  
13 solar and renewable energy. TEP believes it is important that all retail providers of energy  
14 participate in the use of renewable energy. However, because ESP customers will also be paying  
15 the System Benefits Charge, they should receive a credit in the amount of the renewable charge  
16 to prevent them from paying twice.  
17

18 In phase two, renewables will continue to be funded through the existing System Benefits  
19 Charge and a commensurate ESP charge. The Commission, in consultation with the parties  
20 through the workshop process, would have the option of requiring UDCs to shift dollars from the  
21 demand side management segment of the System Benefits Charge to the renewable portfolio  
22 program. TEP estimates that implementation of phase two would produce over \$16 million  
23 statewide annually for renewable development.  
24

25 In phase three, after review of the Renewable Portfolio Standard program, the  
26 Commission could consider an additional funding mechanism to further ratchet up the amount of  
27  
28

1 dollars devoted to renewable energy, likely some sort of surcharge on generation services which  
2 would be imposed by both UDCs and ESPs. By this time, it is anticipated that competition will  
3 be more fully developed; the additional charge will be far less likely to stunt the growth of the  
4 competitive market than now.

5 In all phases of this proposal, the type of renewable energy which will satisfy the  
6 Renewable Portfolio Standard should be broadly defined to include such sources as wind, landfill  
7 gas, etc. Although there is no question that solar power has strong potential in Arizona, the  
8 Commission should not encourage the development of solar power to the exclusion of other  
9 environmentally friendly sources of energy.  
10

11 **V. Conclusion.**

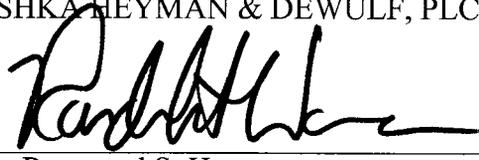

12 TEP's proposal will foster development of long-term, sustainable growth in the solar and  
13 renewable industries and will provide for recovery of investment, for both generating facilities  
14 and manufacturing plants. It will not require rate increases and will not stifle competition. It is  
15 the most sensible and fair means of encouraging the development of renewable energy resources.  
16

17 For the foregoing reasons, TEP respectfully requests that the Commission adopt its  
18 proposal for the Renewable Portfolio Standard.
